Photo Drenching in Chamomile Tea Solution

A portfolio by Celin Aubele

8 Photos drenched in Tea Solution for 12 hours.

Note: My prints only printed yellow and a little other colour, due to my ink having ran low. After re-doing the process with full colour prints – but not drenching them immediately after print – the paper changed colour, but the colours stayed *relatively* the same

Process:

1) Preparing the Container

a) Fill the container with chamomile tea and let it set for 5-10 minutes.
b) Add a little dish soap (preferably colour pink) to the solution.
c) Add some olive oil and vegetable oil to the solution.

2) Starting the Process.

a) Print the photos and immediately spray vegetable and olive oil onto the photos
b) First, put them face up completely submerged for about a minute.
c) Then, turn over the photos so they face down and fully submerge them.
d) Leave for 12-24 hours in solution

3) Removing the photos

a) Move all the photos into an empty container. Size doesn't matter as long as at least 1 photo fits in
b) Fill the container with water and move the photos around a little
c) Take each photo out singularly and run some water down the photo.

4) Finishing and Drying

a) Use a rough bristle sponge (not metallic) and brush a little over the photos.
b) Leave the photos to dry for 1-5 hours, preferably in the sun.
